Amino Acid

The side chain (R) determines the type of the amino acid

Physico-chemical Properties

The properties of the amino acid depends on the side chain

Amino acid	Abbrev.	Side chain	Hydro-phobic	Polar	Charged	Small	Tiny	Aromatic or Aliphatic	van der Waals volume	Codon	Occurrence in proteins (%)
Alanine	Ala, A	-CH ₃	X	-	-	X	X	-	67	GCU, GCC, GCA, GCG	7.8
Cysteine	Cys, C	-CH ₂ SH	X	-	-	X	-	-	86	UGU, UGC	1.9
Aspartate	Asp, D	-CH ₂ COOH	-	X	negative	X	-	-	91	GAU, GAC	5.3
Glutamate	Glu, E	-CH ₂ CH ₂ COOH	-	X	negative	-	-	-	109	GAA, GAG	6.3
Phenylalanine	Phe, F	-CH ₂ C ₆ H ₅	X	-	-	-	-	Aromatic	135	UUU, UUC	3.9
Glycine	Gly, G	-H	X	-	-	X	X	-	48	GGU, GGC, GGA, GGG	7.2
Histidine	His, H	-CH ₂ -C ₃ H ₃ N ₂	-	X	positive	-	-	Aromatic	118	CAU, CAC	2.3
Isoleucine	Ile, I	-CH(CH ₃)CH ₂ CH ₃	X	-	-	-	-	Aliphatic	124	AUU, AUC, AUA	5.3
Lysine	Lys, K	-(CH ₂) ₄ NH ₂	-	X	positive	-	-	-	135	AAA, AAG	5.9

Peptide Bond

Torsion Angles

Backbone torsion angles determine the structure of the protein

Protein folding

Protein folding is the **process by which a protein assumes its native structure** from the unfolded structure

T T C C P S I V A R S N F N V C R L P G T P E A L C A T
Y T G C I I I P G A T C P G D Y A N

The Anfinsen's hypothesis

The sequence contains all the information to specify 3-D structure

Anfinsen showed that denatured ribonuclease A could be re-activated removing the denaturant.

Levinthal's paradox

A protein chain composed by 100 residues with 2 possible conformations has 2^{100} ($\sim 10^{30}$) possible conformations. Considering a time-step of 10^{-12} s for visiting each conformation, the folding process would take 10^{18} s, that is longer than the age of our Universe ($2-3 \times 10^{17}$ s)

The Anfinsen's Dogma

Uniqueness: requires that the sequence does **not have any other configuration with a comparable free energy.**

Stability: **small changes** in the surrounding environment **not affect the structure of the stable conformation.** This can be pictured as a free energy surface that looks more like a funnel and the free energy surface around the native state must be rather steep and high, in order to provide stability.

Kinetical accessibility: means that the path in the **free energy surface** from the unfolded to the folded state **must be reasonably smooth** or, in other words, that the folding of the chain must not involve highly complex changes in the shape.

Aspects of the same problem

The solution of the protein folding consists in the understanding of three different aspects of the problem:

- Estimate the **stability of the native conformation** and thermodynamic of the process.
- Define the mechanism and the **kinetic of the process**.
- Predict the native **three-dimensional structure** of the protein.

Folding and stability

The folding free energy difference, ΔG_F , is typically small, of the order of -5 to -15 kcal/mol for a globular protein (compared to e.g. -30 to -100 kcal/mol for a covalent bond).

Folding interactions

Several **electrostatic interactions** are **contributing** to the **stability** of the native state but they are **not the driving forces** in the folding process

Type	Examples	Binding energy (kcal/mol)	Change of free energy water to ethanol (kcal/mol)	
Electrostatic interaction	Salt bridge	$\text{---COO}^- \cdots \text{N}^+\text{H}_3\text{---}$	-5	-1
	Dipole-dipole	$\begin{array}{c} \delta^+ \quad \delta^- \quad \delta^- \quad \delta^+ \\ \diagdown \quad \diagup \quad \diagdown \quad \diagup \\ \text{C}=\text{O} \cdots \text{O}=\text{C} \\ \diagup \quad \diagdown \quad \diagup \quad \diagdown \end{array}$	+0.3	
Hydrogen bond	Water	$\begin{array}{c} \text{H} \quad \text{H} \\ \diagdown \quad \diagup \\ \text{O}-\text{H} \cdots \text{O} \\ \diagup \quad \diagdown \\ \text{H} \end{array}$	-4	
	Protein backbone	$\begin{array}{c} \diagdown \quad \diagup \\ \text{N}-\text{H} \cdots \text{O}=\text{C} \\ \diagup \quad \diagdown \end{array}$	-3	
Dispersion forces	Aliphatic hydrogen	$\begin{array}{c} \quad \\ \text{---C---H} \cdots \text{H---C---} \\ \quad \end{array}$	-0.03	
Hydrophobic forces	Side chain of Phe			-2.4

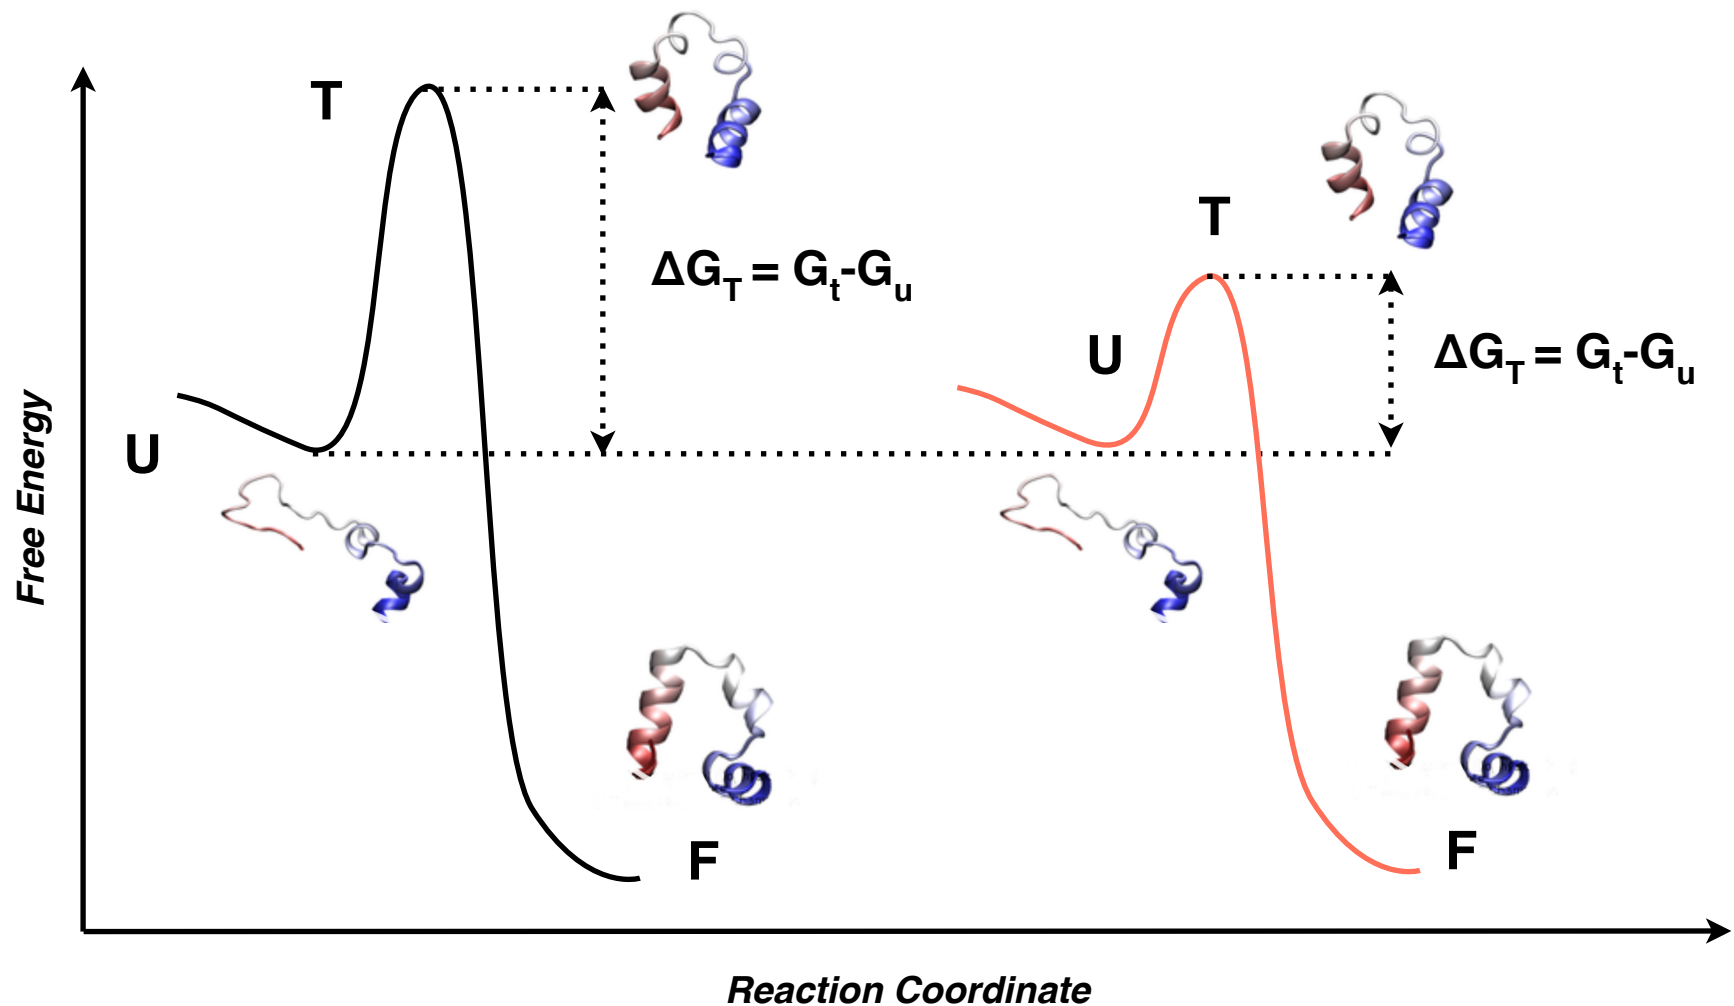

Hydrophobic effect

- Water molecules form a cage-like structure around the nonpolar molecule.
- The positive ΔH is due to the fact that the cage has to be broken to transfer the nonpolar molecule.
- The positive ΔS is due to the fact that the water molecules are less ordered (an increase in the degree of disorder) when the cage is broken.

Folding kinetics

The protein **folding mechanism depends on the form of the free energy profile.**
Higher activation barrier corresponds to longer folding time

Hierarchical organization of protein structure

Protein structure is defined by four levels of hierarchical organization.

Secondary structure (I)

- Helices observed in proteins are mostly right-handed.
- Typical ϕ , ψ values for residues in α -helix are around -60° ; -50°
- Side chains project backward and outward.
- The core of α -helix is tightly packed.

Secondary structure (II)

- Typical ϕ , ψ values for residues in β -sheet are around 140° , -130°
- Side chains of neighboring residues project in opposite directions.
- The polypeptide is in a more extended conformation.
- Parallel β -sheets are less stable than anti-parallel β -sheets.

More complex structures

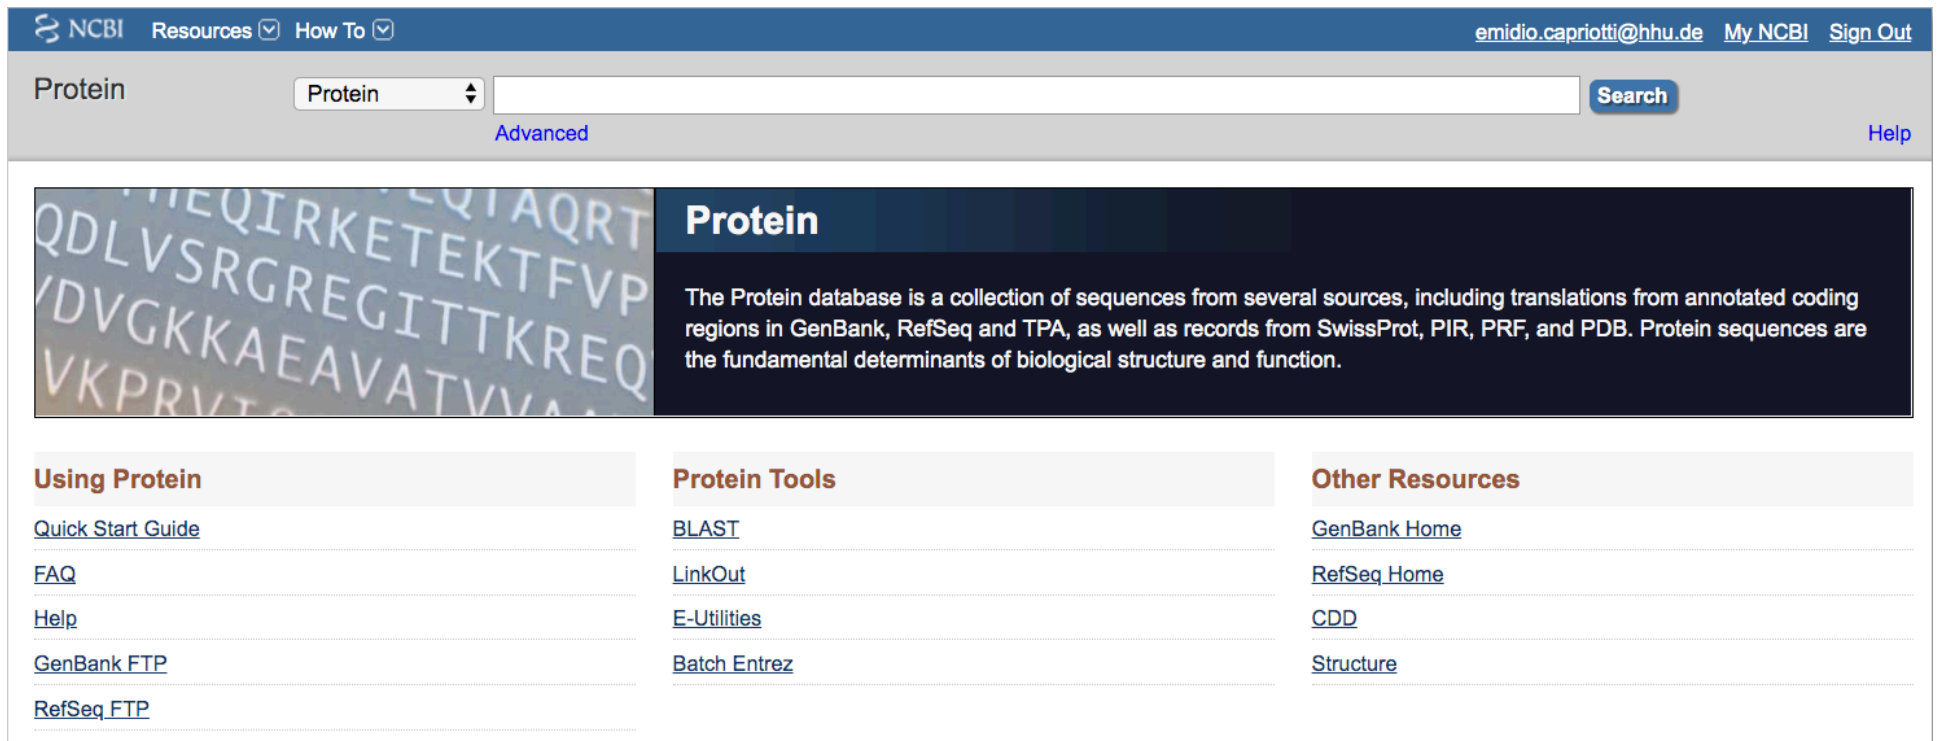

The arrangements of secondary structural elements form the Tertiary Structure of the protein.

The complex of **two or more protein domains defines the Quaternary Structure**. In the example Four-helix-bundle, EF-hand and SH2 domains together form an integrated phosphoprotein that functions as a negative regulator of many signaling pathways from receptors at the cell surface.

Protein at the NCBI

The Protein database is a collection of sequences from several resources accessible through Entrez

The screenshot shows the NCBI Protein database homepage. At the top, there is a navigation bar with "NCBI", "Resources", and "How To" menus. On the right, it displays the user "emidio.capriotti@hhu.de" and options for "My NCBI" and "Sign Out". Below the navigation bar is a search area with a dropdown menu set to "Protein", a search input field, and a "Search" button. A "Help" link is also present. The main content area features a large image of protein sequences on the left and a dark blue box with the title "Protein" and a descriptive paragraph on the right. Below this, there are three columns of links: "Using Protein" (Quick Start Guide, FAQ, Help, GenBank FTP, RefSeq FTP), "Protein Tools" (BLAST, LinkOut, E-Utilities, Batch Entrez), and "Other Resources" (GenBank Home, RefSeq Home, CDD, Structure).

Protein

The Protein database is a collection of sequences from several sources, including translations from annotated coding regions in GenBank, RefSeq and TPA, as well as records from SwissProt, PIR, PRF, and PDB. Protein sequences are the fundamental determinants of biological structure and function.

Protein Sequence DB

The main database of protein sequences is UniProt which is composed by SwissProt and TrEMBL

The mission of UniProt is to provide the scientific community with a comprehensive, high-quality and freely accessible resource of protein sequence and functional information.

UniProtKB
UniProt Knowledgebase

Swiss-Prot (563,552)
 Manually annotated and reviewed.
Records with information extracted from literature and curator-evaluated computational analysis.

TrEMBL (195,104,019)
 Automatically annotated and not reviewed.
Records that await full manual annotation.

UniRef

The UniProt Reference Clusters (UniRef) provide clustered sets of sequences from the UniProt Knowledgebase (including isoforms) and selected UniParc records.

UniParc

UniParc is a comprehensive and non-redundant database that contains most of the publicly available protein sequences in the world.

Proteomes

A proteome is the set of proteins thought to be expressed by an organism. UniProt provides proteomes for species with completely sequenced genomes.

UniProt Composition

Database of annotated proteins

- Swiss-Prot: Manually annotated ~560K
- TrEMBL: Automatically annotated ~220M

The SwissProt

SwissProt contains all the **proteins that have been manually annotated** using information extracted from literature.

UniProtKB/Swiss-Prot

UniProtKB/Swiss-Prot is the expertly curated component of UniProtKB (produced by the UniProt consortium). It contains hundreds of thousands of protein descriptions, including function, domain structure, subcellular location, post-translational modifications and functionally characterized variants.

📍 UniProt is one of the most widely used protein information resources in the world, and an ELIXIR Core Data Resource.

Function¹
Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2 expression. In cooperation with mitochondrial PPIF is involved in activating oxidative stress-induced necrosis; the function is largely independent of transcription. Induces the transcription of long intergenic non-coding RNA p21 (lincRNA-p21) and lincRNA-Mkl1. LincRNA-p21 participates in TP53-dependent transcriptional repression leading to apoptosis and seem to have to effect on cell-cycle regulation. Implicated in Notch signaling cross-over. Prevents CDK7 kinase activity when associated to CAK complex in response to DNA damage, thus stopping cell cycle progression. Isoform 2 enhances the transactivation activity of isoform 1 from some but not all TP53-inducible promoters. Isoform 4 suppresses transactivation activity and impairs growth suppression mediated by isoform 1. Isoform 7 inhibits isoform 1-mediated apoptosis. [11 Publications](#)

Exercise

From the UniProt FTP web site (<ftp://ftp.expasy.org/databases/uniprot/>) download the Human protein UP000005640_9606 in fasta format.

- What is the total number of human proteins in the SwissProt and TrEMBL dataset?
- Given the fasta file containing the protein sequence of P53 what is the total number of residues?

The Protein Data Bank

The largest repository of macromolecular structures obtained mainly by X-ray crystallography and NMR

The screenshot shows the top navigation bar of the RCSB PDB website. It includes a dark blue header with white text for navigation: 'RCSB PDB', 'Deposit', 'Search', 'Visualize', 'Analyze', 'Download', 'Learn', 'More', 'Documentation', and 'Careers'. On the right is a 'MyPDB' button. Below the navigation bar is a search bar with the placeholder text 'Enter search terms or PDB ID(s)'. To the left of the search bar is the RCSB PDB logo and the text '183793 Biological Macromolecular Structures Enabling Breakthroughs in Research and Education'. Below the search bar are links for 'Advanced Search' and 'Browse Annotations', and a 'Help' icon. At the bottom of the header are logos for 'PDB-101', 'WORLDWIDE PDB PROTEIN DATA BANK', 'EMDataResource', 'NUCLEIC ACID DATABASE', and 'Worldwide Protein Data Bank Foundation'. On the right side of the header is a 'Celebrating' banner for 'YEARS OF Protein Data Bank' with social media icons for Facebook, Twitter, YouTube, and LinkedIn.

A vertical navigation sidebar on the left side of the page. It has a dark blue background with white text and icons. The items are: 'Welcome' with a blue bookmark icon, 'Deposit' with a white upload icon, 'Search' with a white magnifying glass icon, 'Visualize' with a white image icon, 'Analyze' with a white grid icon, 'Download' with a white download icon, and 'Learn' with a white book icon.

A Structural View of Biology

This resource is powered by the Protein Data Bank archive—information about the 3D shapes of proteins, nucleic acids, and complex assemblies that helps students and researchers understand all aspects of biomedicine and agriculture, from protein synthesis to health and disease.

As a member of the wwPDB, the RCSB PDB curates and annotates PDB data.

The RCSB PDB builds upon the data by creating tools and resources for research and education in molecular biology, structural biology, computational biology, and beyond.

Exercise

Download the PDB file of the Ribonuclease A (PDB: 7RSA) from the web (<http://ftp.rcsb.org/pub/pdb/data/structures/all/pdb/pdb7rsa.ent.gz>) and perform the following tasks

- Run a shell command to calculate the number of residues of the protein?
- Write a python script to parse the PDB file.
- Modify the program to calculate the distance between to atoms and residues.
- Calculate the average and standard deviation of the distance between two consecutive α carbons?

Defining protein structure

Basic information for the characterization of the protein three-dimensional structures are:

- ϕ , ψ values for each residue in the protein chain
- secondary structure
- solvent accessible area

Ramachandran Plot

The backbone of the protein structure can be defined providing the list of ϕ , ψ angles for each residue in the chain.

Ramachandran Analysis

DSSP program

Program that implements the algorithm “Define Secondary Structure of Proteins”.

The method calculates different features of the protein structure such as the ϕ , ψ angles for each residue, its secondary structure and the solvent accessible area.

DSSP: <ftp://ftp.cmbi.ru.nl/pub/software/dssp>
more details at <https://swift.cmbi.umcn.nl/gv/dssp/>

Relative solvent accessibility

The relative solvent accessible area is obtained dividing the accessible area of the residue by an estimation of its maximum accessible surface.

Normalization

An estimation of the maximum surface of an amino acid is based on a **tripeptide model** with the specific amino acid (X) surrounded by two Glycines in the **extended conformation**.

What is the limitation of such model?

Exercise

Download the DSSP file of the Ribonuclease A (PDB: 7RSA) from the web (<ftp://ftp.cmbi.umcn.nl/pub/molbio/data/dssp/7rsa.dssp>) and answer the following questions

- What is the total **number of residues in helical and extended conformations**?
- What is the **average value of the ϕ and ψ angles** for the residues in **helical and extended conformations**?
- Are the average values falling the the correct region of the Ramachandran plot?
- Considering the solvent accessibility values reported in the DSSP file, calculate the **relative solvent accessible area** for Lysine, Valine and Glutamine with maximum solvent accessible area of 205, 142 and 198 respectively
- Are this value compatible with the physico-chemical properties of the residues?
